EDUCATION

Rutgers University-New Brunswick

New Brunswick, NJ

B.S. Computer Science, B.A. Mathematics, Minor in Statistics

Expected Graduation: May 2029

Relevant Coursework: Data Structures, Computer Architecture, Linear Algebra, Probability Theory, Linear Optimization, Differential Equations, Multivariable Calculus

Student Organizations: Rutgers Quantitative Finance Club, Rutgers Competitive Programming Club, Rutgers Math Association, Rutgers Blockchain

EXPERIENCE

Rutgers Algorithmic Robotics & Control Lab

Mar. 2026 – Present

Undergraduate Researcher

New Brunswick, NJ

- Increased system configuration evaluation throughput by 25% by integrating PyTorch inference components into a graph-data pipeline that generated numerical scores for automated comparison.
- Enabled end-to-end 3D motion prediction from human-video inputs by delivering a Python and PyTorch training and inference pipeline for downstream execution workflows.
- Improved model accuracy by 10% by building a repeatable evaluation framework that benchmarked learned models against baseline methods and aggregated metrics across experiment runs.
- Established reliable, reproducible machine learning experiments by resolving data-flow, tensor shape, model-inference, and Python/C++ integration defects across model and simulation components.

PROJECTS

Model Evaluation Platform | Python, Next.js, Supabase, OpenAI API

- Built a full-stack evaluation platform that executed hundreds of repeatable AI test cases, stored experiment results in Supabase, and converted model responses into structured performance metrics.
- Developed Python scoring and regression-testing pipelines with automated CI/CD quality gates to compare model versions, detect performance degradation, and block releases below defined thresholds.

Decision-Support Assistant | React, TypeScript, Node.js, PostgreSQL

- Developed a full-stack application that integrated user data, calendar availability, travel-time calculations, and external REST APIs to generate context-aware recommendations.
- Designed Node.js workflow logic and PostgreSQL data models for persistent user profiles, constraint processing, and stateful recommendation workflows.

Large-Scale Usage Analysis | SQL, R, Tableau

- Built reusable SQL and R data-processing workflows to clean, transform, and analyze more than 1 million bike-sharing records, reducing processing time by 25%.
- Aggregated behavioral, seasonal, and segment-level metrics into structured datasets and Tableau dashboards for downstream trend analysis and reporting.

TECHNICAL SKILLS

Languages: Python, C++, C, SQL, Java, TypeScript, JavaScript, R

Frameworks: PyTorch, pandas, NumPy, FastAPI, Pydantic, React, Next.js, Node.js

Tools: Git, Docker, Linux, PostgreSQL, Supabase, REST APIs, CI/CD, AWS, Google Cloud Platform, Tableau
